

CARE FOLLOWING SYLC™ PROPHY THERAPY FOR SENSITIVE TEETH

- Initially your teeth and mouth may have a sandy feel directly after the procedure.
- Avoid eating or drinking for 1 hour so the applied minerals can form a protective enamel-like layer on your teeth.
- Syc™ works quickly. Your teeth should no longer feel sensitive and should appear cleaner and brighter too! The desensitizing benefits of Syc™ are expected to last for up to 6 months. It may be reapplied at each 6 month cleaning appointment.
- You may support and prolong the benefits of Syc™ by brushing twice daily with Sensodyne Repair and Protect desensitising tooth paste, the only toothpaste which also contains the active ingredient NovaMin®, (a bioactive glass and advanced calcium phosphate technology proven to reduce dentine sensitivity and the major (>99%) component, within Syc™).
